Tissue Conditioning

A tissue conditioner has been applied to your dentures. Tissue conditioners appear to be clear, gel-like liquids which set over the course of a week to a pliable white paste covering the fitting surface of the dentures. Tissue conditioners work by cushioning the denture surfaces and providing an impression of the gums during function. It is vital therefore, that the dentures are worn as much as possible during this period. There will be a lot of excess paste extruding over the teeth. This is to be ignored. Do not pick at the paste or scrub the dentures. Do not use denture cleaning tablets or solutions; the dentures are simply to be rinsed under running water and left in fresh water overnight.
